This book was used to teach Continuous Time Finance at Courant. If you're interested in really using arbitrage theory in research or practice it's best to learn this material more than once, and this book does a great job applying the stochastic calculus to various models including the classic Black-Scholes option pricing formulas, FX, interest rate models including swaps and LIBOR market models.

The arbitrage theory for the term structure of interest rates is given particular consideration. Also included is a self-contained exposition of stochastic optimal control, with applications to portfolio optimisation. The mathematical development is precise but avoids the explicit use of measure theory.

Arbitrage Theory in Continuous Time (PDF)

By taking expectation, conditioned at time s , from both sides we get $E[X(t)|F_s] = E[X(s)|F_s] + E \int_s^t \mu(z) dz | F_s = X(s) + E \int_s^t \mu(z) dz | F_s \geq X(s)$ so X is a sub martingale. Exercise 4.6 Set $X(t) = h(W_1(t), \dots, W_n(t))$. We have by Itô that $dX(t) = \sum_{i=1}^n \partial h / \partial x_i dW_i(t) + \frac{1}{2} \sum_{i,j=1}^n \partial^2 h / \partial x_i \partial x_j dW_i(t) dW_j(t)$ where $\partial h / \partial x_i$

Arbitrage Theory In Continuous Time Solutions. Arbitrage Pricing Theory The fundamental foundation for the arbitrage pricing theory is the law of one price, which states that 2 identical items will sell for the same price, for if they do not, then a riskless profit could be made by arbitrage—buying the item in the cheaper market then selling it in the more expensive market.
