In MSXML, we create a root or parent element, and then go on inserting the child elements. Nodes can be anything. It can be an element node, it can be an attribute node etc. There are several types of nodes available. They are documented on MSDN. You can create a node by passing the appropriate flag, like NODE\_ELEMENT, to the CreateNode() function.

### **How to create a simple XML file using MSXML in C++ ...**

XDocument(System.Xml.Linq) is from the LINQ to XML API and XmlDocument(System.Xml.XmlDocument) is the standard DOM-style API for XML. If you're using .NET version 3.0 or lower, you have to use XmlDocument, the classic DOM API. On the other hand, if you are using .NET version 3.5 onwards, you need to use XDocument.

### **XML Manipulation In C#**

In the above example, we typed various items on the same line. If you are creating a long XML document, although creating various items on the same line is acceptable, this technique can make it (very) difficult to read. One way you can solve this problem is to separate tags with empty spaces. Here is an example:
